Zadatak 4. Odrediti potrebnu površinu armature za **T** presek poznatih dimenzija, opterećen građičnim momentom savijanja M_u . Podaci za proračun:

$$B = 105 \text{ cm}$$

$$d = 40 \text{ cm}$$

$$M_u = 94.16 \text{ kNm}$$

$$b = 20 \text{ cm}$$

$$d_p = 10 \text{ cm}$$

$B/b = 105/20 \text{ cm} > 5$ - može se koristiti približan postupak sa zanemarenjem nosivosti rebara (ukoliko se neutralna linija nađe u rebru)

$$\text{pretp. } a_1 = 6.5 \text{ cm} \Rightarrow h = 40 - 6.5 = 33.5 \text{ cm}$$

$$\sigma_{bp} = \frac{M_{au}}{B \times d_p \times \left(h - \frac{d_p}{2} \right)} = \frac{94.16 \times 10^2}{105 \times 10 \times \left(33.5 - \frac{10}{2} \right)} = 0.31 \text{ kN/cm}^2 = 3.1 \text{ MPa}$$

Kako je $d_p = 10 \text{ cm} < 12 \text{ cm}$, to se računska čvrstoća umanjuje za 10%, pa je:

$$f_B = 0.9 \times 20.5 = 18.45 \text{ MPa} = 1.845 \text{ kN/cm}^2$$

$$\varepsilon_{bp} = 2 \times \left(1 - \sqrt{1 - \frac{\sigma_{bp}}{f_B}} \right) = 2 \times \left(1 - \sqrt{1 - \frac{3.1}{18.45}} \right) = 0.179\% ; \quad \varepsilon_a = 10\%$$

$$x_0 = \frac{\varepsilon_{bp}}{\varepsilon_{bp} + \varepsilon_a} \times \left(h - \frac{d_p}{2} \right) = \frac{0.179}{0.179 + 10} \times \left(33.5 - \frac{10}{2} \right) = 0.50 \text{ cm} < d_p/2 = 5 \text{ cm}$$

Neutralna linija se nalazi u ploči, pa se presek proračunava kao pravougaoni, širine $B = 105 \text{ cm}$:

$$k = \frac{h}{\sqrt{\frac{M_u}{B \times f_B}}} = \frac{33.5}{\sqrt{\frac{94.16 \times 10^2}{105 \times 1.845}}} = 4.805 \Rightarrow \varepsilon_b/\varepsilon_a = 1.105/10\% ; \quad \bar{\mu} = 4.488\% ; \quad s = 0.100$$

$$x = s \times h = 0.100 \times 33.5 = 3.35 \text{ cm} < d_p = 10 \text{ cm} \quad (\text{kontrola položaja neutralne linije})$$

$$A_{a,potr.} = 4.488 \times \frac{105 \times 33.5}{100} \times \frac{1.845}{24} = 12.14 \text{ cm}^2 \Rightarrow \text{usvojeno: } \mathbf{5Ø18} (12.72 \text{ cm}^2)$$

$$a_1 = \frac{3 \times 4.5 + 2 \times 9.5}{5} = 6.5 \text{ cm} \Rightarrow h_{stv.} = 40 - 6.5 = 33.5 \text{ cm} = h_{pretp.}$$
